

Abstract

The purpose of this study was to determine the effect of the treatment of the soil on the growth of the plants. The results of the study are as follows: The plants which were treated with the soil which had been treated with the chemical fertilizer showed a higher growth rate than the plants which were treated with the soil which had not been treated with the chemical fertilizer. The results of the study are as follows: The plants which were treated with the soil which had been treated with the chemical fertilizer showed a higher growth rate than the plants which were treated with the soil which had not been treated with the chemical fertilizer.

The following table shows the results of the study.
